1 ALAN QUESTION

Describe in detail what is happening in the diagram below.

In the diagram, the semantic analyzer is determining if b is a valid variable within the print statement in scope 1b. To make this determination, the semantic analyzer will look at the hashmap for scope 1b to find b. Unfortunately, b was not declared in the scope, so the semantic analyzer then has to check the parent of scope 1b, which is scope 0. Fortunately, b was declared in scope 0, so the print statement is valid. However, if b was not in scope 0, then an undeclared variable error would have to be thrown.
